

UEP vs EEP — paired difference statistics

Difference = UEP - EEP for each matched condition (same loss, channel, placement). Positive = UEP better. Mean diff and std err on the mean; RMSE / MSE measure magnitude of disagreement; t and p from a paired test. Per-song n = 12, pooled n = 36.

Green mean diff = UEP significantly better ($p < 0.05$); red = EEP significantly better; black = not significant. RMSE is in score points (0-100 scale); MSE = RMSE².
